Contents:

1° Noble ideal gas: Internal energy $U$
   - First law: $\Delta U = Q - W$
   - $\Delta U = \frac{3}{2} nR \Delta T$, if $n$ constant
   - Isobar: $W = P \Delta V$, $Q = \Delta U + W$
   - Isochore: $W = 0$, $Q = \Delta U$
   - Isotherm: $\Delta U = 0$, $Q = W$
   - Adiabat: $Q = 0$, $\Delta U = -W$

2° Specific heats $c_V$ and $c_P$
   - Numerical examples

3° Cyclic process in $P-V$ diagram
   - Net work is area of cycle

4° Heating one mole of Helium in fixed volume $V = 1 \text{ m}^3$

5° Heat engines
   - Efficiency
   - Second law of thermodynamics
   - Example 15.3: Burning coal to make electricity
